1. PURPOSE AND DESIGN OF THE ISAT TESTING PROGRAM

In April 2003, students in grades 3, 5, and 8 took Illinois Standards Achievement Tests (ISAT) in reading, mathematics, and writing. Students in grades 4 and 7 took ISAT tests in science and social science. Approximately 700,000 students enrolled in public elementary and secondary schools across the state participated in the testing program. ISAT measures the extent to which students are meeting the Illinois Learning Standards. Illinois teachers and curriculum experts developed the ISAT tests in cooperation with the Illinois State Board of Education (ISBE).

This manual provides technical information about the 2003 test administration. It describes the tests and assessment approaches and addresses technical concerns. Other reports, documents, or publications issued by the Illinois State Board of Education (ISBE) provide additional information about interpreting test results (*Guide to the 2003 Illinois State Assessment, Understanding Your Child's ISAT Scores*) that is not included here.

General Procedures

Each ISAT test is designed to ensure that its results validly and fairly assess the Illinois Learning Standards. The selection of items and assembly of each test is guided by a set of specifications. These specifications were developed by Illinois educators to help ensure that test content corresponds to the purposes, objectives, and skills framed by the learning standards.

Illinois teachers and administrators participate in all phases of the test development process: item writing, item selection, bias review, and test assembly. The State Board of Education convenes a series of advisory committees to ensure that test development is continually informed and guided by the recommendations of content authorities, measurement specialists, and practitioners. The following evaluation criteria are applied to all assessment material used in the Illinois program:

Content. Every item is screened for alignment with the Illinois Learning Standards, grade-level appropriateness, importance, and clarity. Incorrect choices (for multiple-choice items) are reviewed for plausibility. In tests other than reading, the complexity of the text of the questions is kept to the minimum necessary to state the problem.

Difficulty. Items are pilot tested on large samples of students prior to their inclusion in tests to develop a statistical profile for each item. Items that are too easy or too difficult and, therefore, provide little or no information are omitted.

Precision. Point-biserial (i.e., item-test) correlations evaluate the extent to which an item distinguishes between less proficient and more proficient students. Reviewers usually omit items with a point-biserial of less than .30 and select items with the highest point-biserial.

Fairness. Test items and forms undergo regular sensitivity reviews and statistical analyses to ensure that all materials meet fairness criteria with respect to the cultural and ethnic diversity of Illinois public schools.

ISBE takes several precautions to help ensure test security. Test materials shipped to schools are packaged and sealed. Each test booklet is bar-coded so that it can be accounted for. The administration of tests is standardized. A series of manuals provides guidance on security and other issues to the district testing coordinator, school testing coordinator, and classroom test administrator. After administration, all materials are removed from schools and returned to a central facility for processing and secure destruction of unneeded materials.

Reading

The ISAT reading test assesses material defined by standards associated with three state learning goals. The standards were developed using the 1985 State Goals for Language Arts, various state and national standards drafts, and local education standards contributed by team members. These learning standards are designed to guide language arts instruction in Illinois schools. This alignment of assessment to curriculum ensures consistency and strengthens the influence of standards and assessment on improved teaching and learning. These standards are:

- Goal 1: Read with understanding and fluency.
 - 1A Apply word analysis and vocabulary skills to comprehend selections.
 - 1B Apply reading strategies to improve understanding and fluency.
 - 1C Comprehend a broad range of reading materials.

- Goal 2: Read and understand literature representative of various societies, eras, and ideas.
 - 2A Understand how literary elements and techniques are used to convey meaning.
 - 2B Read and interpret a variety of literary works.

- Goal 5: Write to communicate for a variety of purposes.
 - 5A Locate, organize, and use information from various sources to answer questions, solve problems, and communicate ideas.
 - 5B Analyze and evaluate information acquired from various sources.
 - 5C Apply acquired information, concepts, and ideas to communicate in a variety of formats.

The reading test has two formats. The grade 3 reading assessment is given in three 40-minute sessions. One of these sessions consists of 12-15 word analysis questions and one passage followed by 15-17 multiple-choice questions. The two remaining sessions include one passage followed by 15-20 multiple-choice questions and one extended-response question.

The reading tests for grades 5 and 8 are also given in three 40-minute sessions. One of these sessions consists of a longer passage with 20-25 multiple-choice questions. The other

two sessions each include one passage with 15-20 multiple choice questions and one extended-response question.

The reading passages and accompanying questions reflect two of the most frequent purposes for reading—reading to gain information and reading for literary experience. The sources for these passages range from high interest, grade-appropriate periodicals to newspapers, short stories, and novels. Illinois teachers reviewed and selected the material for these tests.

The multiple-choice questions require students to select one correct response from four possibilities presented to them. Again, teachers in Illinois played an active part in writing, reading, and editing these test questions. Questions must meet both content and statistical criteria for inclusion in the test.

The extended-response questions on the reading test require students not only to read and understand a text, but also to analyze, evaluate, and interpret the text as a means of making connections and conclusions related to the text. The rubric used to score the extended-response items is a holistic scoring rubric. It describes characteristics of different levels of achievement in reading. The levels of achievement on the reading rubric range from 0 to 4 (4 being the highest score). Responses with scores of 0 indicate that the student response is insufficient to effectively determine evidence of achievement in reading. Responses with scores of 1 and 2 indicate developing levels of achievement in reading. Responses with scores of 3 indicate a developed level of achievement in reading. Finally, responses with scores of 4 represent a well-developed level of achievement in reading. The rubric was developed with Illinois educators.

In addition to an overall reading score, results are reported in terms of the percent of items correctly answered within five “standard sets” (six at grade 3). These scores are as follows:

- *Comprehension: Literary Works:* Understanding of passages taken from sources such as novels, short stories, and periodicals. (Standards 1B, 1C, 2A, 2B, 5A, 5B, 5C)
- *Comprehension: Informational Sources:* Understanding of nonfiction texts such as student periodicals, newspapers, and trade journals. (Standards 1B, 1C, 2A, 2B, 5A, 5B, 5C)
- *Application of Strategies: Explicit Ideas:* Identifying important information directly stated in the text. (Standards 1B, 5A)
- *Application of Strategies: Inferences from Text:* Analyzing important information in the text to draw logical conclusions about the text. (Standards 1C, 2A, 2B, 5B, 5C)
- *Vocabulary:* Using contextual clues and other skills to understand key words, phrases, and concepts in literary and informational texts. (Standard 1A)
- *Word Analysis (3rd grade only):* Using phonics, word pattern, and other word analysis skills to recognize new words. (Standard 1A)

Mathematics

People use mathematics to identify, describe, and investigate the patterns and challenges of everyday living. Mathematics helps us to understand events that have occurred and to predict and prepare for events to come so that we can more fully understand our world and more successfully live in it. Mathematics encompasses arithmetic, measurement, algebra, geometry, trigonometry, statistics, probability, and other fields. It deals with numbers, quantities, shapes, and data, as well as numerical relationships and operations. Confronting, understanding, and solving problems are at the heart of mathematics. Mathematics is much more than a collection of concepts and skills; it is a way of approaching new challenges through investigating, reasoning, visualizing, and problem-solving with the goal of communicating the relationships observed and problems solved to others.

The ISAT mathematics tests are designed to measure the following learning standards:

- Goal 6: Demonstrate and apply a knowledge and sense of numbers, including numeration and operations (addition, subtraction, multiplication, division), patterns, ratios, and proportions.
 - 6A Demonstrate knowledge and use of numbers and their representations in a broad range of theoretical and practical settings.
 - 6B Investigate, represent, and solve problems using number facts, operations (addition, subtraction, multiplication, division) and their properties, algorithms, and relationships.
 - 6C Compute and estimate using mental mathematics, paper-and-pencil methods, calculators, and computers.
 - 6D Solve problems using comparison of quantities, ratios, proportions, and percents.
- Goal 7: Estimate, make, and use measurements of objects, quantities, and relationships and determine acceptable levels of accuracy.
 - 7A Measure and compare quantities using appropriate units, instruments, and methods.
 - 7B Estimate measurements and determine acceptable levels of accuracy.
 - 7C Select and use appropriate technology, instruments, and formulas to solve problems, interpret results, and communicate findings.
- Goal 8: Use algebraic and analytical methods to identify and describe patterns and relationships in data, solve problems, and predict results.
 - 8A Describe numerical relationships using variables and patterns.
 - 8B Interpret and describe numerical relationships using tables, graphs, and symbols.
 - 8C Solve problems using systems of numbers and their properties.
 - 8D Use algebraic concepts and procedures to represent and solve problems.

- Goal 9: Use geometric methods to analyze, categorize, and draw conclusions about points, lines, planes, and space.
 - 9A Demonstrate and apply geometric concepts involving points, lines, planes, and space.
 - 9B Identify, describe, classify, and compare relationships using points, lines, planes, and solids.
 - 9C Construct convincing arguments and proofs to solve problems.
 - 9D Use trigonometric ratios and circular functions to solve problems.

- Goal 10: Collect, organize, and analyze data using statistical methods; predict results; and interpret uncertainty using concepts of probability.
 - 10A Organize, describe, and make predictions from existing data.
 - 10B Formulate questions, design data collection methods, gather and analyze data, and communicate findings.
 - 10C Determine, describe, and apply the probabilities of events.

Illinois teachers developed the Illinois Learning Standards for mathematics. These goals, standards, and benchmarks are an outgrowth of the 1985 Illinois State Goals for Learning influenced by the latest thinking in school mathematics. This includes the National Council of Teachers of Mathematics; Curriculum and Evaluation Standards for School Mathematics; ideas underlying recent local and national curriculum projects; results of state, national, and international assessment findings; and the work and experiences of Illinois school districts and teachers.

The mathematics assessment includes 70 scored multiple-choice items administered in two test sessions. A third session contains two extended-response/problem-solving tasks.

In addition to an overall mathematics score, results are reported in terms of the percent of items correctly answered within eight standard sets. These scores are as follows:

- *Estimation/Number Sense/Computation:* Demonstrating an understanding of numbers, their representations, and number operations of addition, subtraction, multiplication, division, percentages, and fractions as appropriate to grade level. (Standards 6A, 6B, 6C, 6D, 8C)

- *Algebraic Patterns/Variables:* Identifying, describing, and extending algebraic, geometric, and numeric patterns and constructing and solving problems using variables. (Standards 8A, 8D)

- *Algebraic Relationships/Representations:* Representing and interpreting algebraic concepts with words, diagrams, tables, coordinate graphs, equations, and inequalities. (Standard 8B)

- *Geometric Concepts:* Identifying and describing points, lines, two- and three-dimensional shapes and their properties, such as parallel; symmetry; perpendicular; and number of sides, faces, and vertices. (Standard 9A)

- *Geometric Relationships:* Sorting, classifying, comparing, and contrasting geometric figures. This category includes such properties as similarity and congruency. (Standards 9B, 9D)
- *Measurement:* Estimating, measuring, and comparing quantities using appropriate units and acceptable levels of accuracy. At higher grades, this category encompasses conversions within measurement systems. (Standards 7A, 7B, 7C)
- *Data Organization/Analysis:* Creating, analyzing, displaying, and interpreting data using a variety of graphs (pictures, tallies, tables, charts, bar graphs, Venn diagrams), and computing the mean, median, mode, and range of given data. (Standards 10A, 10B)
- *Probability:* Determining, describing, and applying elementary probability theory and fundamental counting principles. At higher grades, this category encompasses combinations and permutations of simple and complex events. (Standard 10C)

Writing

The state goal for writing states that the student will be able to write Standard English in a grammatical, well-organized, and coherent manner for a variety of purposes. The learning standards associated with the goal are as follows:

- 3A Use correct grammar, spelling, and punctuation.
- 3B Compose well-organized and coherent writing.
- 3C Communicate ideas in writing to accomplish a variety of purposes.

The writing assessment uses three types of prompts, which represent persuasive, expository, and narrative discourse modes. Persuasive topics require students to take a position on an issue or to state a problem and solution. Expository topics require students to explain, interpret, or describe something objectively and clearly. Narrative topics require students to reflect upon and describe an experience or event from personal knowledge. Readers evaluate each paper with respect to its focus, support/elaboration, organization, and conventions. They also evaluate how effectively the paper integrates these features.

Students in grades 5 and 8 wrote one assigned essay. All students within a grade received the same assignment. They then selected a second topic (or prompt) from a list of two and wrote a second essay. Third-grade students received one of three topics and wrote an essay on the assigned topic.

Readers score all papers with respect to four specific features (focus, support/elaboration, organization, and conventions) and a holistic feature (integration). Descriptions of these features follow:

- *Focus:* the degree to which the subject, issue, theme, or unifying event of the composition is clear and maintained.
- *Support/Elaboration:* the quality of the detail or support through reasons and explanations.

- *Organization*: the extent to which a clear structure or plan of development is maintained and the points logically related to each other and the text structure.
- *Conventions*: the extent to which the writer demonstrates adequate knowledge of Standard English.
- *Integration*: the extent to which the paper as a whole uses the four features (focus, support/elaboration, organization, and conventions) to address the assignment.

Readers rate a paper's first three features and its overall integration on a scale from 1 (absent) to 6 (well developed). The conventions feature is evaluated as either 1 (not developed) or 2 (developed). A composite writing score is derived from the raw feature scores according to the following formula:

$$\text{Focus} + \text{Support/Elaboration} + \text{Organization} + \text{Conventions} + (2 \times \text{Integration})$$

The overall writing score ranges from 6 to 32. For students who wrote more than one essay (grades 5, 8), writing scores for each essay were averaged and then rounded up. Thus, individual student scores at all grades are reported as whole numbers. Scores for schools, districts, and the state are reported to one decimal place.

Science

Science is a creative endeavor of the human mind. It offers a special perspective on the natural world in terms of understanding and interaction. The Illinois Learning Standards for science are organized by goals that inform one another and depend upon one another for meaning. Expectations for learners related to the inquiry process are presented in standards addressing the application of science and elements of technological design.

The ISAT science tests are designed to measure the following three learning standards.

- Goal 11: Understand the process of scientific inquiry and technological design to investigate questions, conduct experiments, and solve problems.
 - 11A Know and apply the concepts, principles, and processes of scientific inquiry.
 - 11B Know and apply the concepts, principles, and processes of technological design.
- Goal 12: Understand the fundamental concepts, principles, and interconnections of the life, physical, and earth/space sciences.
 - 12A Know and apply concepts that explain how living things function, adapt, and change.
 - 12B Know and apply concepts that describe how living things interact with each other and with their environment.
 - 12C Know and apply concepts that describe properties of matter and energy and the interactions between them.
 - 12D Know and apply concepts that describe force and motion and the principles that explain them.

- 12E Know and apply concepts that describe the features and processes of Earth and its resources.
- 12F Know and apply concepts that explain the composition and structure of the universe and Earth’s place in it.
- Goal 13: Understand the relationships among science, technology, and society in historical and contemporary contexts.
 - 13A Know and apply the accepted practices of science.
 - 13B Know and apply concepts that describe the interaction between science, technology, and society.

The science assessment consists of single-correct-answer, multiple-choice items. In addition to an overall score, results are reported in terms of the percent of items correctly answered within five standard sets. These scores are as follows:

- *Scientific Inquiry*: Understanding and applying knowledge of experimental and technological design including data analysis, use of scientific instruments, and the metric system. (Standards 11A and 11B)
- *Life Sciences*: Understanding and applying knowledge of biology and ecology. (Standards 12A and 12B)
- *Physical Sciences*: Understanding and applying knowledge of chemistry and physics. (Standards 12C and 12D)
- *Earth and Space Sciences*: Understanding and applying knowledge of geology, weather, renewable resources, astronomy, and space science. (Standards 12E and 12F)
- *Science, Technology, and Society*: Understanding and applying knowledge of safety, valid sources of data, and ethical practices. Understanding and applying knowledge of the history and sociology of science, ethics, environmental issues, and recycling. (Standards 13A and 13B)

A set of science pilot items and a set of health/physical development items used for conducting state studies bring the total number of items in each test to 80. The pilot items do not contribute to test scores.

The Productive Thinking Scale (PTS) is used to evaluate the quality of science items. It is hierarchical with respect to the production of knowledge and independent of an item’s difficulty or grade. Four cognitive skills define the hierarchy of productive thinking in generating scientific knowledge. Each skill applies to both content (knowledge) and to process (research methods): (1) recall of conventions, whether names or norms; (2) reproduction of empirical facts or methodological tools and steps; (3) production of solutions to problems or research designs; and (4) creation of new theories and methods. The PTS subdivides reproduction and production into secondary processes. Hence, the PTS comprises six levels of productive thinking on a scale from low level (recall of conventional uses) to high level (creation of new theory).

Based on estimates of the thought processes which most students must use to answer an item, each item is ranked as to the level of conceptual skill it requires. Items that provide a rough balance across the middle ranks are selected, and items at the level of vocabulary or rote memory are usually omitted. Items are also examined to determine whether there is a reasonable distribution of items within the tests among major learning areas: earth science, physical science, and life science.

Social Science

Social science provides students with an understanding of themselves and of society, prepares them for citizenship in a democracy, and gives them the basics for understanding the complexities of the world community. The study of social science helps people develop the ability to make informed and reasoned decisions for the public good as citizens of a culturally diverse, democratic society in an interdependent world.

The ISAT social science tests are designed to measure the following learning standards:

- Goal 14: Understand political systems with an emphasis on the United States.
 - 14A Understand and explain basic principles of the United States government.
 - 14B Understand the structures and functions of the political systems of Illinois, the United States, and other nations.
 - 14C Understand election processes and responsibilities of citizens.
 - 14D Understand the roles and influences of individuals and interest groups in the political systems of Illinois, the United States, and other nations.
 - 14E Understand United States foreign policy as it relates to other nations and international issues.
 - 14F Understand the development of United States political ideas and traditions.

- Goal 15: Understand economic systems with an emphasis on the United States.
 - 15A Understand how different economic systems operate in the exchange, production, distribution, and consumption of goods and services.
 - 15B Understand that scarcity necessitates choices by consumers.
 - 15C Understand that scarcity necessitates choices by producers.
 - 15D Understand trade as an exchange of goods or services.
 - 15E Understand the impact of government policies and decisions on production and consumption in the economy.

- Goal 16: Understand events, trends, individuals, and movements shaping the history of Illinois, the United States, and other nations.
 - 16A Apply the skills of historical analysis and interpretation.
 - 16B Understand the development of significant political events.
 - 16C Understand the development of economic systems.
 - 16D Understand Illinois, United States, and world social history.
 - 16E Understand Illinois, United States, and world environmental history.

- Goal 17: Understand world geography and the effects of geography on society, with an emphasis on the United States.
 - 17A Locate, describe, and explain places, regions, and features on Earth.
 - 17B Analyze and explain characteristics and interactions of Earth's physical systems.
 - 17C Understand relationships between geographic factors and society.
 - 17D Understand the historical significance of geography.

- Goal 18: Understand social systems with an emphasis on the United States.
 - 18A Compare characteristics of culture as reflected in language, literature, the arts, traditions, and institutions.
 - 18B Understand the roles and interactions of individuals and groups in society.
 - 18C Understand how social systems form and develop over time.

The social science assessment consists of single-correct-answer, multiple-choice items. In addition to an overall score, results are reported in terms of the percent of items correctly answered within five standard sets. These scores are as follows:

- *Government*: Understanding and applying knowledge of political systems, including the basic principles and traditions of the U.S. government, the structure and functions of government, the election process, and foreign policy. (Standards 14A, 14B, 14D, 14F, and 18B)
- *Economics*: Understanding and applying knowledge of economic systems and the nature of the U.S. economy, including the choices people make in the production and distribution of goods and services and the relationship of governments to trade and economic practices. (Standards 15A, 15B, 15C, 15D, and 15E)
- *Geography*: Demonstrating the ability to locate places, regions, and features; to understand characteristics of Earth's physical system and the relationship between geographic factors and society; and to understand the historical significance of geography. (Standards 17A, 17B, 17C, and 17D)
- *United States History*: Understanding and analyzing the development of political events, economic systems, and social systems. (Standards 16A, 16B, 16C, 16D, 16E, 18A, 18B, and 18C)
- *Global Perspectives*: Understanding and applying knowledge of the political, economic, historical, social, and environmental events and conditions in the world beyond the United States. (Standards 14B, 14E, 16A, 16B, 16C, 16D, 16E, 18A, 18B, and 18C)

2. RELIABILITY

The reliability of a test reflects the degree to which scores are free from random errors of measurement. Test reliability indicates the extent to which differences in test scores reflect real differences in the ability being measured and thus, the consistency of test scores across some change of condition, such as a change of test items or a change of time. Different reliability coefficients result from different changes in testing conditions. For example, test-retest reliability measures the extent to which scores remain constant over time. A low test-retest reliability coefficient means that a person's scores are likely to shift unpredictably from one time to another.

Internal Consistency of Overall Scores

Because the items used in achievement tests represent only a relatively small sample from a much larger domain of items, the consistency of test scores across items is of particular interest. That is, how precisely will tests rank students if different sets of items from the same domain were used? Unless the rankings are very similar, it is difficult or impossible to make educationally sound decisions on the basis of test scores. This characteristic of test scores is most commonly referred to as *internal consistency*. Table 2.1 presents internal consistency values (coefficient alpha) for each of the tests administered in the assessment.

Table 2.1
Reliability Estimates

Grade	Reading	Mathematics	Writing	Science	Social Science
03	.94	.94	.87		
04				.92	.91
05	.93	.94	.90		
07				.90	.91
08	.93	.96	.91		

Note: Sample sizes on which these coefficients are based are as follows:

Reading: 3 (15,927), 5 (15,879), 8 (15,891)
Mathematics: 3 (15,950), 5 (15,916), 8 (15,852)
Writing: 3 (144,915), 5 (145,989), 8 (147,812)
Science: 4 (15,950), 7 (15,882)
Social Science: 4 (15,963), 7 (15,889)

The reliability coefficients reported in Table 2.1 are derived within the context of classical test theory (CTT) and provide a single measure of precision for the entire test. Within the context of item response theory (IRT), it is possible to measure the relative precision of the test at different points on the scale. Figure 2.1 presents the test information functions for the four ISAT reading tests; Figures 2.2, 2.3, and 2.4 present comparable information for the ISAT mathematics tests, science tests, and social science tests, respectively. IRT scaling is not used with the writing test.

The amount of information at any point is directly related to the precision of the test. That is, precision is highest where information is highest. Conversely, where information is lowest, precision is lowest and ability is most poorly estimated. As is evident from the figures, the information functions for these tests are highest near the points on the scales where the “meets standards” cut scores are located.

Figure 2.1
ISAT Reading Test Information Functions

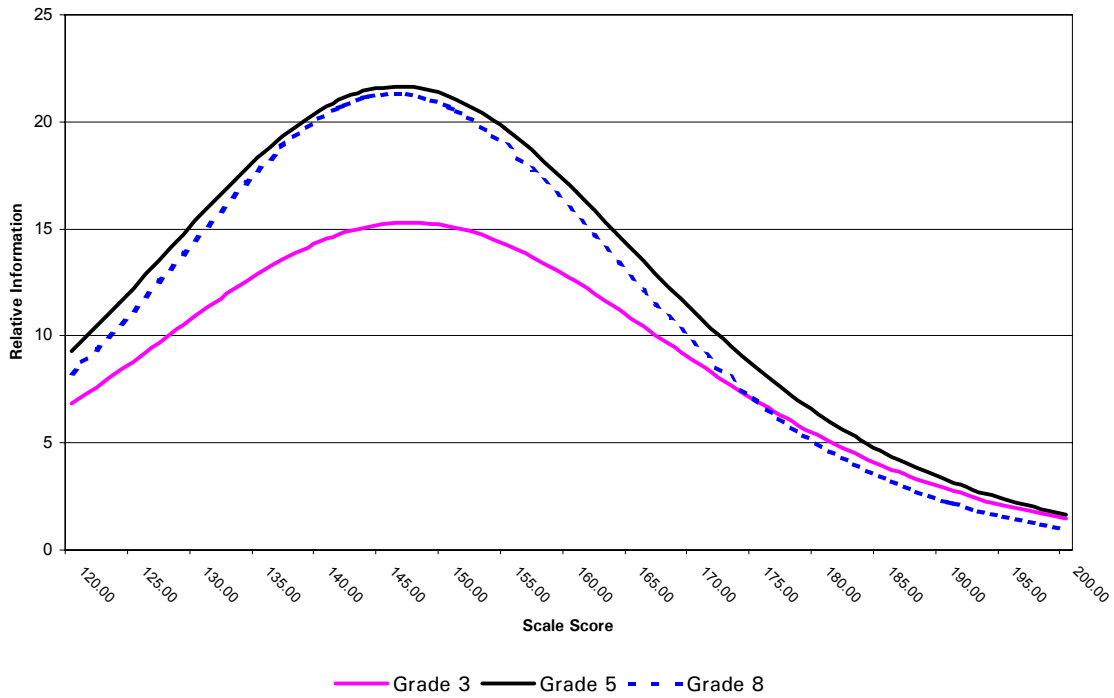

Figure 2.2
ISAT Mathematics Test Information Functions

Figure 2.3
ISAT Science Test Information Functions

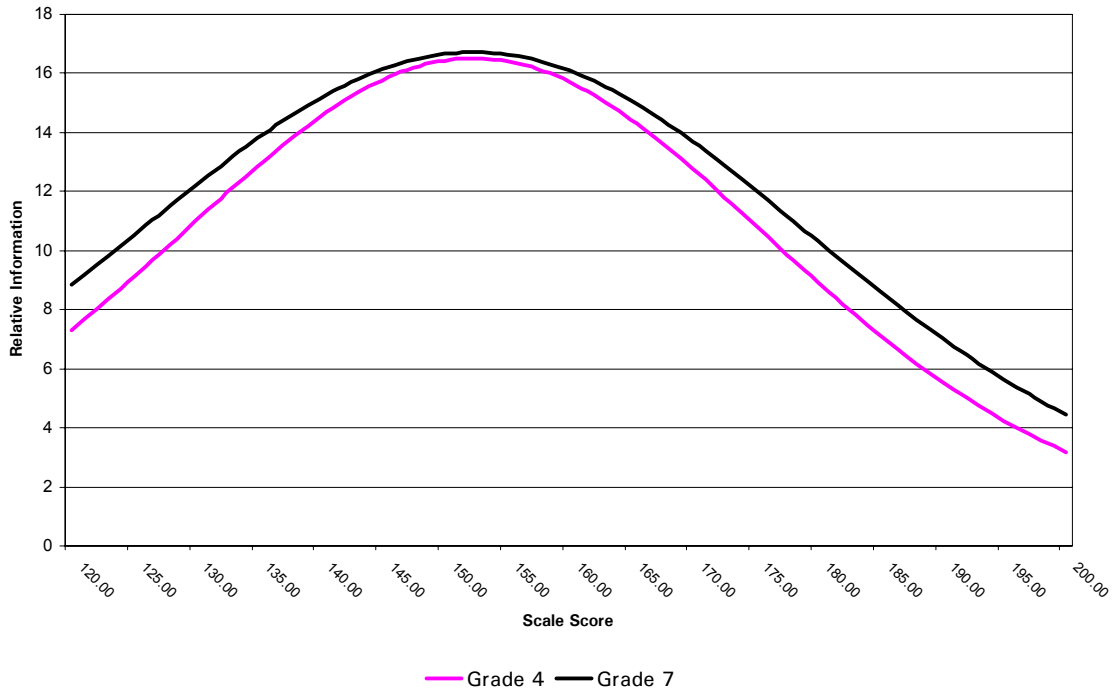

Figure 2.4
ISAT Social Science Test Information Functions

A second way of evaluating precision from the IRT perspective is in terms of how well the test as a whole separates people. The ratio of the standard deviation of ability estimates, after subtracting from their observed variance the error variance attributable to their standard errors of measurement, to the root mean square standard error computed over persons, provides this index (Wright & Stone, 1979). These values are reported in Table 2.2. Person separation values of 3 and above indicate a high degree of measurement precision. As the table indicates, the ISAT reading, mathematics, science, and social science tests show consistently high levels of test precision across all the grade levels tested. Person separation values for the reading and mathematics tests are exceptionally high.

Table 2.2
Person Separation Values for the ISAT Tests

	Reading	Mathematics
Grade 3	3.45	3.47
Grade 5	3.36	3.48
Grade 8	3.22	3.90
	Science	Social Science
Grade 4	3.12	3.03
Grade 7	2.83	2.99

Reliability of the Writing and Extended-Response Scores

Writing scores are affected by other sources of variance, particularly readers (raters), since different readers evaluate different students and prompts. The effect attributable to prompts is important for students at all grades. However, it can only be evaluated directly for 5th- and 8th-grade students who wrote on two different prompts.

Interrater Agreement. Interrater agreement evaluates the consistency of scores assigned to the same essay by different readers. For the writing assessment, interrater agreement was monitored daily, and two readers independently scored 10% of the student essays across grades and prompts. The interrater agreement coefficients for all features and discourse modes are summarized in Table 2.3. The results for the interrater agreement on double-scored papers exceeded the minimum acceptable level of agreement (90% agreement within one point). Scores across raters agree within one point at least 96% of the time.

Table 2.3
Interrater Agreement for Writing Scores

Discourse Mode	Score	% Exact Agreement	% Adjacent Agreement	% Exact + Adjacent
Persuasive (n = 11,807)	Focus	70	26	96
	Support	60	38	98
	Organization	62	36	98
	Conventions	98	2	100
	Integration	63	35	98
Expository (n = 26,811)	Focus	71	24	95
	Support	61	37	98
	Organization	62	36	98
	Conventions	97	3	100
	Integration	63	35	98
Narrative (n = 11,199)	Focus	62	34	96
	Support	61	37	98
	Organization	60	37	97
	Conventions	93	7	100
	Integration	63	35	98

A parallel procedure was also developed for monitoring scoring of extended responses in reading and mathematics. For the reading test, raters provided a single score for the extended-response item, while extended-response items in the mathematics test were scored for knowledge, strategy, and explanation. Tables 2.4 and 2.5 present interrater agreement statistics for extended responses in reading and mathematics, respectively.

Table 2.4
Interrater Agreement for Reading Extended-Response Items

	% Exact Agreement	% Adjacent Agreement	% Exact + Adjacent
Grade 3 (N = 12,448)			
Item 1	63	34	97
Item 2	66	31	97
Grade 5 (N = 13,601)			
Item 1	64	35	99
Item 2	66	33	99
Grade 8 (N = 13,578)			
Item 1	71	28	99
Item 2	71	28	99

Table 2.5
Interrater Agreement for Mathematics Extended-Response Items

	Score	% Exact Agreement	% Adjacent Agreement	% Exact + Adjacent
Grade 3				
Task 1 (N = 13,288)	Knowledge	78	18	96
	Strategy	71	20	91
	Explanation	51	39	90
Task 2	Knowledge	81	17	98
	Strategy	73	21	94
	Explanation	55	38	93
Grade 5				
Task 1 (N = 14,461)	Knowledge	92	7	99
	Strategy	86	11	97

Task 2	Knowledge	88	11	99
	Strategy	88	10	98
	Explanation	65	30	95
Grade 8				
Task 1 (N = 14,014)	Knowledge	87	12	99
	Strategy	82	14	96
	Explanation	60	35	95
Task 2	Knowledge	78	21	99
	Strategy	78	21	99
	Explanation	60	37	97

Agreement with Validation Papers. In addition to agreement across raters, writing scores are checked against a standard, or “validation,” set of papers. The Validation Committee assigns the scores for these papers. Essay packets, each containing 10 essays, were circulated among the readers. Essays for these check sets were chosen to represent a range of score points in all categories.

Table 2.6
Agreement with Validation Papers for Writing Scores

Readers encountered the validation packets at random intervals throughout the scoring, and some encountered several packets during the scoring process. Readers were unaware of the scores assigned to the papers by the committee. The extent of agreement between a reader's scores and the scores assigned to the papers was calculated every day during the scoring and shared with the readers. This process allowed for the monitoring of reader scoring. The results for all grades, features, and discourse modes are summarized in Table 2.6. Again, the results exceeded the minimum acceptable level of agreement (90% agreement within one point). The agreement of readers with validation papers was higher than the interrater agreement. This is possibly attributable to the fact that the validation papers are specifically selected to illustrate all points on the scoring scale. The papers that are selected for double scoring, on the other hand, represent a more nearly random selection of papers and scores. Consequently, they are likely to include proportionately fewer extreme scores (e.g., 1, 6), on which there is likely to be higher agreement between raters.

A set of validation papers was also developed for monitoring scoring of extended responses in reading and mathematics. For the reading test, raters provided a single score for the extended-response item, while extended-response items in the mathematics test were scored for knowledge, strategy, and explanation. Tables 2.7 and 2.8 present agreement with validation papers for extended responses in reading and mathematics, respectively.

Reliability of the Performance Category Decisions

Students' ISAT scores are reported relative to four performance categories: Academic Warning, Below Standards, Meets Standards, and Exceeds Standards. Sets of score cutoffs were developed for each learning area and each grade. The development of the score cutoffs that define these categories is fully documented in separate publications available from ISBE (*Performance Levels for the Illinois Standards Achievement Tests: Reading, Mathematics, Writing and Performance Levels for the Illinois Standards Achievement Tests: Science, Social Science*). However, the process may be briefly described as follows.

Prior to the meetings of the standard-setting panels themselves, which took place during April 1999 (reading, mathematics, writing) and April 2000 (science, social science), ISBE convened committees of curriculum experts to develop concrete descriptions of student knowledge and skill levels that define the specific performance categories. Educators throughout Illinois extensively reviewed these descriptions.

Panels of recognized subject matter experts convened in Springfield to translate the verbal descriptions into cut scores on the ISAT tests (i.e., scores that define the boundaries

between categories). Panelists were drawn from a pool of educators who had specific knowledge of student performance at the grade levels being assessed by ISAT and experience in assessing students at those grade levels. Panelists were selected to be broadly representative of the geographic and ethnic diversity of Illinois' public school system. A total of 170 educators participated in the standard-setting process. The distribution of educators across learning areas was as follows: mathematics—56; writing—62; reading—52; science—30; social science—30.

A procedure originally proposed by Angoff is one of the most frequently used methods for determining cut scores when multiple-choice test scores are used. It can be most simply described as a focused, judgmental process by knowledgeable content experts. The basic Angoff procedure fit the format of the ISAT reading, mathematics, science, and social science tests. However, certain modifications of the basic procedure were developed to fit the format of the ISAT writing tests.

In the most frequent application of the Angoff method (e.g., to establish a pass-fail standard), panelists are asked to examine an item and decide what proportion of minimally competent individuals will answer the question correctly. With respect to the ISAT, however, instead of being asked about minimally competent students, panelists were asked to indicate what percentage of three groups of students—those who were just above the Academic Warning/Below Standards boundary, those who were just above the Below Standards/Meets Standards boundary, and those who were just above the Meets Standards/Exceeds Standards boundary—would answer the question correctly. The ratings were made sequentially rather than simultaneously (i.e., panelists made all judgments relative to one cut score before moving to the next cut score). Item performance statistics were provided to help panelists anchor their ratings. The cutoff scores that resulted are shown in Table 2.9. Results of applying these cutoffs to the 2003 test population are shown later in Section 4.

The reliabilities of such classifications, which are criterion-referenced, are related to the reliabilities of the tests on which they are based, but they are not equivalent to the test reliabilities, which are based on norm-referenced measurement. Glaser (1963) was among the first to draw attention to this distinction, and Feldt and Brennan (1989) extensively reviewed the topic.

Table 2.9
ISAT Cutoffs for Each Performance Level

READING	Academic Warning	Below Standards	Meets Standards	Exceeds Standards
03	120-137	138-155	156-173	174-200
05	120-129	130-155	156-170	171-200
08	120-128	129-151	152-172	173-200
MATHEMATICS	Academic Warning	Below Standards	Meets Standards	Exceeds Standards
03	120-141	142-152	153-172	173-200
05	120-137	138-157	158-190	191-200
08	120-137	138-161	162-184	185-200
WRITING	Academic Warning	Below Standards	Meets Standards	Exceeds Standards
03	6-13	14-21	22-29	30-32
05	6-13	14-20	21-27	28-32

SCIENCE	Academic Warning	Below Standards	Meets Standards	Exceeds Standards
04	120-138	139-153	154-178	179-200
07	120-141	142-150	151-174	175-200
SOCIAL SCIENCE	Academic Warning	Below Standards	Meets Standards	Exceeds Standards
04	120-141	142-156	157-183	184-200
07	120-132	133-156	157-178	179-200

As Feldt and Brennan (1989, p. 140) point out, approaches to the development of reliability coefficients for criterion-referenced interpretations of test scores have been based either on squared-error loss or threshold loss. It is threshold loss, which evaluates the consistency with which people are consistently classified with respect to a criterion, that is of greater concern here. Specifically, the issue is how consistently do tests classify students with respect to the performance standards?

Two threshold-loss coefficients have been developed: p , the proportion of persons consistently classified on two parallel tests, and k (kappa), which corrects p for the proportion of consistent classifications that would be expected by chance. Because scores on classically parallel tests are rarely available in practice, methods have been developed to estimate these values from a single test (Subkoviak, 1984). An approach proposed by Peng and Subkoviak (1980) was applied to the performance classifications made on the basis of the tests.

Table 2.10 presents the values for p , k , and p_{miss} , the expected proportion of inconsistent decisions, which is simply $(1 - p)$. In interpreting the first two indexes, Feldt and Brennan (1989) suggest that p reflects the *consistency of decisions* made about examinees, whereas k , since it is corrected for chance, reflects the *contribution of the test* to the consistency of the decision.

Overall, the values suggest that decisions made with respect to the student performance classifications would be very consistent. Note that the p and k values are calculated for the complete test population. Values for other test populations (e.g., IEP students alone, non-IEP students only) may differ.

Table 2.10
Reliability of Student Performance Decisions Based on Test Scores

3. SCALING AND EQUATING PROCEDURES

ISAT reading, mathematics, science, and social science scores are reported on a standard score scale. Individual student scores on this scale range between 120 and 200, regardless of the characteristics of the raw score distribution. Each scale is defined by letting 160 represent the average proficiency of the first-year test population. Every unit on the scale represents 1/15 of the standard deviation of proficiency scores for the first-year population. In other words, the first-year mean and standard deviation of scale scores for each grade are 160 and 15. Results in subsequent years are equated to the base-year scale. The scaling constants used to transform the Rasch proficiency estimates to the reporting scale are shown in Table 3.1.

Table 3.1
ISAT Scaling Constants

	Slope	Intercept
Reading		
Grade 3	12.6428	146.2066
Grade 5	12.0100	144.7660
Grade 8	11.2280	141.7730
Mathematics		
Grade 3	13.5122	147.6910
Grade 5	14.9686	153.4644
Grade 8	14.7578	146.7806
Science		
Grade 4	15.3781	152.4255
Grade 7	15.9209	152.4527
Social Science		
Grade 4	14.6746	149.2394
Grade 7	16.6587	148.9095

Because test items change each year, raw scores (i.e., number or percent correct scores) will not always have the same meaning or represent the same level of proficiency. Without equating, each administration of a test with different items would lead to a new reporting scale, independent of that used previously. It would still be possible to measure relative performance, but it would not be possible to indicate growth across years for schools, districts, or the state. The equating process makes longitudinal comparisons possible.

The statistical fit of the one-parameter logistic (1PL) or Rasch model to the ISAT multiple-choice tests has been previously examined and found to be satisfactory. The 1PL model uses only the item difficulty and the person's proficiency level to describe the probability of a correct response to an item. The 1PL model is the simplest of currently available IRT models and is perhaps the one in widest use today.

The equating procedures may be summarized as follows. Each test contains a sufficient number of items that have been previously administered to provide a reliable and content-representative equating link. During calibration of the new tests, item difficulties for these

linking items are set to their historical values. By estimating values for the remaining items under this constraint, difficulty values for the remaining items are expressed on the existing scale. That is, the proficiency (θ) scale that results from the constrained calibration run is equated to the existing scale. The final step in the procedure is to apply equations that transform values on the proficiency scale to their corresponding ISAT scale score values. These equations were originally developed during the first year of equating and are then applied in each subsequent year of equating.

The logic of the equating procedure rests on certain assumptions. The most important is that the items used for linking stay the same in the two tests. During the assembly of tests, items that will be used for equating are placed exactly at or very near the location in the booklet where they previously appeared to minimize effects from positional differences. Differences between the anchored difficulties and the best-fit values are examined to ensure that no unusually large differences exist that would strain the equivalence assumption.

The equating analyses are conducted on samples of approximately 16,000 drawn from the total test population. A 1/nth selection results in a sample that has characteristics essentially identical with that of the total population.

Successive years' test forms, which have different items, are equated so that test scores will remain comparable across administrations. Each new test form contains a sufficient number of items that have been previously administered to provide a reliable and content-representative equating link. During calibration of the new tests, item difficulties for these linking items are set to their historical values. By estimating values for the remaining items under this constraint, difficulty values for the remaining items are automatically adjusted to the existing scale. The final step in the procedure is to apply equations that transform values on the proficiency scale to their corresponding scale score values. These equations were developed during the first year of testing.

ISAT also uses two forms of the reading test¹. At each grade, two passages (and their associated items) are identical across the two forms, and one passage is different. Because the two tests are not exactly equal in difficulty, scores on the two forms are statistically equated using the one-parameter (Rasch) model. The two forms were jointly calibrated, which places the difficulty of both sets of items on the same scale and makes proficiency estimates equivalent across test forms. IRT scaling is also used with the ISAT mathematics tests.

Tables 3.2 through 3.4 show results of the Rasch calibration and equating procedures for reading. Column 1 of each table shows the Form in which the item appeared, A for Form A alone, B for Form B alone, AB for items that appeared in both forms. Column 2 of each table shows the item number within the test booklet. Column 3 shows the Rasch difficulties resulting from an anchored (constrained) calibration of the test. Column 4 shows the standard error of the difficulty estimate (S_{ed}). The next two columns present statistics designed to assess how well the test "fits" the IRT model. Both are standardized, mean square statistics with an expected value of 1.00 (indicating perfect fit). The first, "Infit," is more sensitive to departures from model fit when item difficulty and person ability are close. The second, "Outfit," is more sensitive to model fit when item difficulty and person

¹ In 2003, only one form of the reading test was used at 3rd grade.

ability are far apart. The last column shows the point-biserial correlation between the item and the rest of the items in the test.

Tables 3.5 through 3.7 show similar information for the mathematics tests. The information is organized in the same way as the earlier tables except no “form” designation is necessary. Tables 3.8 and 3.9 present information for the science tests, and Tables 3.10 and 3.11 present information for the social science tests.

75	-0.12	0.02	0.92	0.89	0.44

The raw score that is initially derived from multiple-choice items has no particular meaning beyond the number of answers the student has answered correctly. Writing, on the other hand, uses criterion-referenced scales. Each point on these scales has a specific interpretation. For example, when readers evaluate the quality of a 3rd-grade persuasive essay's focus, they assign a score of 6 when the paper "sets its purpose in an introduction through either a general thematic introduction or a specific preview, maintains the position or logic throughout, addresses any previewed points, and provides an effective closing." They assign a score of 3 when the paper "lacks clarity, provides multiple positions without a unifying umbrella statement, contains responses that do not serve a persuasive purpose, or lacks sufficiency to demonstrate a developed focus." Transforming writing scores to another scale would lose the specific meanings attached to each score point. For this reason, the ISAT writing score is a simple summation of the features. Because of the importance of Integration, it is given double weight in the summation. This leads to a writing score that ranges from 6 to 32.

4. RESULTS

Performance Relative to the Illinois Learning Standards

Table 4.1 shows the percentages of students by performance level and by grade for reading. The percentage of students falling into the Exceeds category is highest at 5th grade. The percentage of students not meeting standards is also highest at 5th grade. Overall, the percentage of students meeting (or exceeding) standards is highest at 8th grade.

Table 4.1
Percentages of Students by Grade Falling into Each Performance Level for ISAT Reading:
1999-2003

Grade/ Year	Academic Warning	Below Standards	Meets Standards	Exceeds Standards
3				
1999	8	31	44	17
2000	6	32	41	21
2001	7	31	43	19
2002	7	31	44	19
2003	8.2	29.9	40.1	21.9
5				
1999	1	38	37	24
2000	0	41	39	20
2001	1	40	34	25
2002	1	39	37	22
2003	1.0	38.6	37.3	23.1
8				
1999	1	27	54	18
2000	0	28	56	16
2001	1	34	56	10
2002	1	31	58	10
2003	0.5	35.8	54.0	9.7

Note: Because of rounding, the percentages in each row may not total exactly to 100%.

Table 4.2 provides additional information with respect to the reading test. It presents the average percent of items students answered correctly with respect to the standard sets that were previously described.

Table 4.2
Reading Average Percent Correct by Standard Sets

Grade	Set					
	1	2	3	4	5	6
03	70	62	72	66	63	73
05	69	70	72	68	68	-
08	68	66	74	65	66	-

Table 4.3 shows the percentages of students by performance level and by grade for mathematics. The percentage of students meeting state standards is highest for grade 3 students and lowest for grade 8 students. The percentage of students falling into the Exceeds category is much higher at grade 3 than at the other two grades.

Table 4.3
Percentages of Students by Grade Falling into Each Performance Level for ISAT Mathematics: 1999-2003

Grade/ Year	Academic Warning	Below Standards	Meets Standards	Exceeds Standards
3				
1999	12	20	47	21

2000	8	46	35	12
2001	7	42	37	13
2002	7	40	37	15
2003	6.3	40.6	37.6	15.5

Note: Because of rounding, the percentages in each row may not total exactly to 100%.

Table 4.4 presents the average percent of items students answered correctly with respect to the mathematics standard sets that were previously described.

Table 4.4
Mathematics Average Percent Correct by Standard Sets

Grade	Set							
	1	2	3	4	5	6	7	8
03	63	68	63	67	71	61	67	66
05	59	58	59	62	63	58	59	65
08	61	59	64	56	48	62	58	60

Table 4.5 shows results for writing. A greater percentage of 5th- grade students meet standards with respect to writing as compared to 3rd-graders and 8th-graders.

Table 4.6 summarizes results with respect to writing feature scores. Note that Conventions is scored on a two-point scale while all other features are scored on a six-point scale.

Table 4.5
Percentages of Students by Grade Falling into Each Performance Level for ISAT Writing: 1999-2003

Grade/ Year	Academic Warning	Below Standards	Meets Standards	Exceeds Standards
3				
1999	9	35	50	6
2000	6	38	53	2
2001	9	33	55	3

04	65	59	62	56	61
07	62	59	58	55	66

Performance Relative to National Quarters

The legislation that authorized the development of ISAT required that reports provide national comparative data as a secondary reference point for evaluating school improvement efforts. Since the costs of obtaining nationally representative samples of

students for each test would be prohibitively expensive, that mandate has been met by administering a nationally standardized achievement test along with ISAT to a sample of Illinois students. The two score distributions are then compared to identify points on the ISAT scale that correspond to the 25th, 50th, and 75th percentile performance levels for the national sample. National norms for writing are not provided because no nationally standardized writing test has a sufficiently satisfactory match to the Illinois content specifications.

ISAT uses the Ninth Edition of the Stanford Achievement Tests (SAT9) for purposes of determining Illinois students' relative standing within the national population. Equipercentile methodology was used to equate scores on the two tests. In equipercentile equating, scores on two tests are assumed to be equivalent if they have the same percentile rank. For example, the SAT9 score that cuts off 10% of the equating sample is assumed to represent a level of proficiency equal to the ISAT score that cuts off 10% of the equating sample, even though the scores themselves may be quite different numerically.

Table 4.11 presents the ISAT scale score cutoffs that define the *upper limits* of national quartile categories 1, 2, and 3. These are shown as score ranges for each national quarter. For example, scale scores of 120 to 145 on the 4th-grade science test define Q1, the quartile that represents the lowest 25% of student performance nationally. Note that although the scale score cutoffs remain the same from year to year, the percentage of students in each category need not remain constant.

The results of applying these cutoffs to the 2003 assessment data are shown in Table 4.12. As noted earlier, results in writing are not reported relative to national quarters.
